NDIS documentation workflow: discovery + prototype

Kith × C51: proposal for the smallest credible discovery (25 October 2026)

Goal

In 4 weeks, with one NDIS provider, find out whether AI-assisted shift and progress notes:

- save support workers real time
- produce notes the provider would sign off for audit
- meet the provider's minimum security and compliance bar

The result is a clear **go / no-go decision on a paid pilot**, with numbers behind it.

Starting point

This isn't a build from zero. Kith Workspace is already live and working (Sydney-hosted):

What it does

- Three input methods: speak, record a meeting, or type / paste.
- Structured notes, including an NDIS progress-note template and an incident-report template (with NDIS / aged-care SIRS prompts).
- "Ask your notes", answering only from the user's own notes.

Security in place

- Data stored in Sydney.
- All note text encrypted.
- Per-user isolation.
- Rate limits.
- Privacy Policy and Terms.
- An automated security test suite (69 checks, all passing).

So the discovery money goes into **fitting one real workflow and proving it**, not into building the basics.

Work breakdown

Week	Work	Who	Output
1. Discover	Kick-off with the provider's operations/compliance lead. Interview 2–3 support workers. Collect their current note templates and 5–10 de-identified sample notes. Map the workflow (capture → review → store → audit). List their documentation obligations: progress notes, incident and reportable-incident handling, record keeping. Run a short security and procurement questionnaire	Kith (technical), C51 (sessions, commercial questions)	2-page **workflow and requirements brief**, agreed with the provider
2. Configure	Set Kith up for that workflow: the provider's own progress-note format and wording, incident flags (prompt when something may be reportable), a mandatory human review	Kith	**Working prototype** on their workflow

Week	Work	Who	Output
	/ sign-off step, and the export format they need (PDF / text / CSV, ready to paste into their system). Create accounts for 3–5 workers		
3. Prove	3–5 workers use it on real shifts for 1–2 weeks, with their usual review process. Kith supports them and fixes issues quickly. In parallel, write the **security and compliance pack** (below)	Kith, provider staff; C51 tracks feedback	Usage data plus the security pack
4. Decide	Measure time per note (before vs after), how much reviewers had to edit, reviewer quality scores and worker feedback. Write the go / no-go report: pilot scope, pricing, rollout plan and costed next steps (e.g. integration with their system, AI processing moved to Australian regions)	Kith (data, technical), C51 (market and commercial assessment)	**Go / no-go report**

Security and compliance pack (delivered in week 3):

- Data residency and the data-flow diagram.
- Encryption and access controls.
- Retention and deletion.
- Incident / breach process.
- Privacy Policy and Terms.
- Draft data processing agreement.
- AI processing disclosure: transcription and note writing currently run on US providers, with model-training opt-outs. The cost of moving to Australian-region AI is included.
- Our security test results.

Responsibilities

Kith	C51	Provider
All technical work, configuration, hosting and AI costs during discovery, security pack, support, measurement	Introduce the provider, run the commercial and market assessment, help with stakeholder sessions, validate pricing and positioning	Give access to 3–5 workers and an ops/compliance lead, share templates and de-identified samples, give feedback, fund the discovery

Timeline

4 weeks from kick-off, Kith working part-time (10–15 h/week), with fast turnaround on issues during the trial week(s). Can start within a week of agreement.

Cost

- **A$4,500 (ex GST), fixed price, funded by the pilot provider.**
- Invoiced by Kith: **50% at kick-off, 50% on delivery of the go / no-go report**. C51's share of the fee is as agreed between Kith and C51.
- Hosting and AI usage for the discovery are included.
- **Not included** (each one is costed in the report if the provider wants it):

- Direct integration with their care-management system (e.g. ShiftCare API).
- Moving AI processing to Australian regions.
- Features beyond configuring the agreed workflow.

Ownership and terms (to confirm in a short written agreement before starting)

- Kith keeps ownership of its platform and code. The provider owns its data and notes. C51 owns its market and commercial materials.
- The provider's data is used only for this discovery, kept in Sydney, and deleted or returned at the end if there's no pilot.
- If the decision is "go", the pilot is priced and agreed separately.
